

PrimeGrid's 27121 Prime Search

On 25 Feb 2012, 06:34:08, PrimeGrid's 27121 Prime Search, through PRPNet and in collaboration with the 12121 Search, has found the mega prime:

$$121*2^{4553899}-1$$

The prime is 1,370,863 digits long and will enter Chris Caldwell's "The Largest Known Primes Database" (<http://primes.utm.edu/primes>) ranked 28th overall. This is PrimeGrid's 22nd mega prime.

The discovery was made by Timothy D. Winslow of the United States using an Intel Intel i7 930 @ 2.8GHz with 12GB RAM, running Microsoft Windows 7 Home Premium 64 bit. This computer took just over 5 hours 49 minutes to complete the primality test using LLR. Timothy is a member of the The Knights Who Say Ni! Team.

The prime was verified on 25 Feb 2012, by an Intel Core i7 2600k @3.4Ghz with 8 GB RAM, running Windows 7 x64. This computer took a little over 2 hours 4 minutes to complete the primality test using LLR x64 AVX.

Credits for the discovery are as follows:

1. Timothy D. Winslow (United States), discoverer
2. PrimeGrid, et al.
3. Srsieve, sieving program developed by Geoff Reynolds
4. PSieve, sieving program developed by Ken Brazier and Geoff Reynolds
5. LLR, primality program developed by Jean Penné

Entry in "The Largest Know Primes Database" can be found here:

<http://primes.utm.edu/primes/page.php?id=105070>

PrimGrid's 27121 Prime Search is a collaboration with the 12121 Search, which was established on 5/24/2004 to search for large primes of the form $121*2^n-1$. Later, on 3/1/2005, they added $k=27$ to their search. Their "short term" goal is to search for n up to 10M. PrimeGrid added the $+1$ form and searches both k 's and forms together.

Using a single PC would have taken years to find this prime. So this timely discovery would not have been possible without the thousands of volunteers who contributed their spare CPU cycles. A special thanks to everyone who contributed their advice and/or computing power to the search - especially all the sievers who work behind the scenes to make a find like this possible.

This is PrimeGrid's 22nd mega prime. The 27121 Prime Search will continue to seek even larger primes. To join the search please visit PrimeGrid:

PrimeGrid's 27121 Prime Search

About PrimeGrid

PrimeGrid is a distributed computing project, developed by Rytis Slatkevičius, Lennart Vogel, and John Blazek, which utilizes BOINC and PRPNet to search for primes. PrimeGrid's primary goal is to bring the excitement of prime finding to the "everyday" computer user. Simply download the software and let your computer do the rest. Participants can choose from a variety of prime forms to search. With a little patience, you may find a large or even record breaking prime.

BOINC

The Berkeley Open Infrastructure for Network Computing (BOINC) is a software platform for distributed computing using volunteered computer resources. It allows users to participate in multiple distributed computing projects through a single program. Currently BOINC is being developed by a team based at the University of California, Berkeley led by David Anderson.

This platform currently supports projects from biology to math to astronomy. For more information, please visit BOINC:

<http://boinc.berkeley.edu>

PRPNet

PRPNet is a client/server application written by Mark Rodenkirch that is specifically designed to help find prime numbers of various forms. It is easily ported between various OS/hardware combinations. PRPNet does not run each PRP test itself, but relies on helper programs, such as LLR, PFGW, phrot, www, and genefer to do the work.
